# **SAIFI/SAIDI indicators and the growing RES penetration**

Viesturs Kadiķis  
PUC Latvia

# Did you experience any changes in the network reliability performance (SAIDI / SAIFI) in the last years?

# **Did you design / implement measures to prevent from potential deterioration of network reliability performance related that the increasing share of intermittent renewable generation?**

- We see that in normal situation SAIDI and SAIFI indicators improving every year, so there are no plan to implement any measures or other actions related to system performance indicators.
- SAIDI and SAIFI targets are not set in LV legislation, but it is hot topic in LV and are under discussion in Regulator.

# What is the role & potential of network flexibility in this context?

---

- Take in to consideration the system topology and smart system elements LV system potential of network flexibility will be some more years.
- At the moment all most all capacity in DSO level are reserved so when all system users will be connected to grid the stability could be decreased.
